

Using Your Heaters

Our reactive heaters are all automatically set to a standard temperature in reaction to the external temperatures. For example, if the ground floor is set to 20 °C, the rest of the floors may be set to 19 °C. Our maintenance team review the temperatures weekly to ensure that they are set to an appropriate temperature depending on the weather and, of course, the heating temperatures will automatically rise as it gets colder.

Temperatures cannot be adjusted in the apartment manually. They are controlled from a central location.
